

## APPENDIX 1. Fever – the Traffic Light System

### Traffic light system for identifying risk of serious illness\*

	Green – low risk	Amber – intermediate risk	Red – high risk
Colour (of skin, lips or tongue)	<ul style="list-style-type: none"> <li>Normal colour</li> </ul>	<ul style="list-style-type: none"> <li>Pallor reported by parent/carer</li> </ul>	<ul style="list-style-type: none"> <li>Pale/mottled/ashen/blue</li> </ul>
Activity	<ul style="list-style-type: none"> <li>Responds normally to social cues</li> <li>Content/smiles</li> <li>Stays awake or awakens quickly</li> <li>Strong normal cry/not crying</li> </ul>	<ul style="list-style-type: none"> <li>Not responding normally to social cues</li> <li>No smile</li> <li>Wakes only with prolonged stimulation</li> <li>Decreased activity</li> </ul>	<ul style="list-style-type: none"> <li>No response to social cues</li> <li>Appears ill to a healthcare professional</li> <li>Does not wake or if roused does not stay awake</li> <li>Weak, high-pitched or continuous cry</li> </ul>
Respiratory		<ul style="list-style-type: none"> <li>Nasal flaring</li> <li>Tachypnoea: <ul style="list-style-type: none"> <li>RR &gt;50 breaths/minute, age 6–12 months</li> <li>RR &gt;40 breaths/minute, age &gt;12 months</li> </ul> </li> <li>Oxygen saturation <math>\leq</math>95% in air</li> <li>Crackles in the chest</li> </ul>	<ul style="list-style-type: none"> <li>Grunting</li> <li>Tachypnoea: RR &gt;60 breaths/minute</li> <li>Moderate or severe chest indrawing</li> </ul>
Circulation and hydration	<ul style="list-style-type: none"> <li>Normal skin and eyes</li> <li>Moist mucous membranes</li> </ul>	<ul style="list-style-type: none"> <li>Tachycardia: <ul style="list-style-type: none"> <li>&gt;160 beats/minute, age &lt;12 months</li> <li>&gt;150 beats/minute, age 12–24 months</li> <li>&gt;140 beats/minute, age 2–5 years</li> </ul> </li> <li>CRT <math>\geq</math>3 seconds</li> <li>Dry mucous membranes</li> <li>Poor feeding in infants</li> <li>Reduced urine output</li> </ul>	<ul style="list-style-type: none"> <li>Reduced skin turgor</li> </ul>
Other	<ul style="list-style-type: none"> <li>None of the amber or red symptoms or signs</li> </ul>	<ul style="list-style-type: none"> <li>Age 3–6 months, temperature <math>\geq</math>39°C</li> <li>Fever for <math>\geq</math>5 days</li> <li>Rigors</li> <li>Swelling of a limb or joint</li> <li>Non-weight bearing limb/not using an extremity</li> </ul>	<ul style="list-style-type: none"> <li>Age &lt;3 months, temperature <math>\geq</math>38°C</li> <li>Non-blanching rash</li> <li>Bulging fontanelle</li> <li>Neck stiffness</li> <li>Status epilepticus</li> <li>Focal neurological signs</li> <li>Focal seizures</li> </ul>
CRT, capillary refill time; RR, respiratory rate			
* This traffic light table should be used in conjunction with the recommendations in the guideline on investigations and initial management in children with fever. See <a href="http://guidance.nice.org.uk/CG160">http://guidance.nice.org.uk/CG160</a> (update of NICE clinical guideline 47).			

### Normal Paediatric Vital Signs

Age	Pulse	Respirations	Systolic BP
<1 year	110-160	30-40	70-90
1-2 years	100-150	25-35	80-95
2-5 years	95-140	25-30	80-100
5-12 years	80-120	20-25	90-110
over 12 years	60-100	15-20	100-120

**1 Life-threatening problems:**

**Airway:** swelling, hoarseness, stridor  
**Breathing:** rapid breathing, wheeze, fatigue, cyanosis, SpO<sub>2</sub> < 92%, confusion  
**Circulation:** pale, clammy, low blood pressure, faintness, drowsy/coma

**2 Adrenaline** (give IM unless experienced with IV adrenaline)

IM doses of 1:1000 adrenaline (repeat after 5 min if no better)

- Adult 500 micrograms IM (0.5 mL)
- Child more than 12 years: 500 micrograms IM (0.5 mL)
- Child 6 -12 years: 300 micrograms IM (0.3 mL)
- Child less than 6 years: 150 micrograms IM (0.15 mL)

Adrenaline IV to be given **only by experienced specialists**

Titrate: Adults 50 micrograms; Children 1 microgram/kg

**3 IV fluid challenge:**

Adult - 500 – 1000 mL  
Child - crystalloid 20 mL/kg

Stop IV colloid if this might be the cause of anaphylaxis

**4 Chlorphenamine**  
(IM or slow IV)

Adult or child more than 12 years	10 mg
Child 6 - 12 years	5 mg
Child 6 months to 6 years	2.5 mg
Child less than 6 months	250 micrograms/kg

**5 Hydrocortisone**  
(IM or slow IV)

200 mg
100 mg
50 mg
25 mg

**Figure 3. Anaphylaxis algorithm**

### High risk criteria

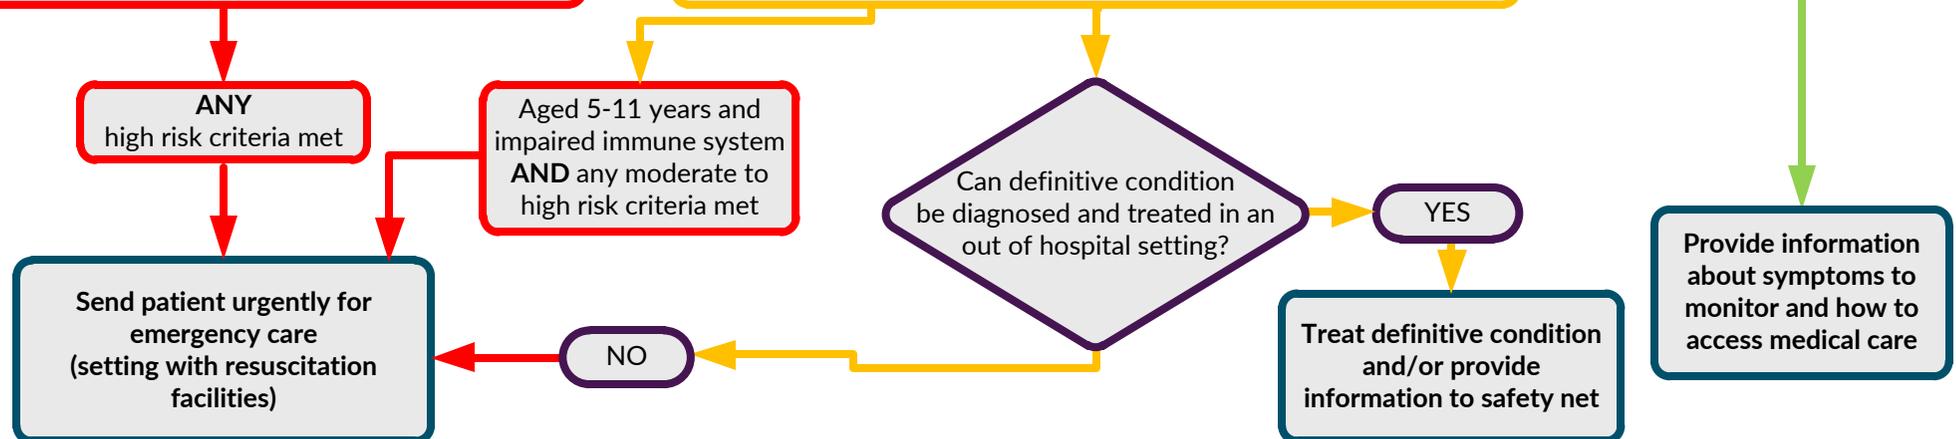

- Behaviour:
  - objective evidence of altered behaviour or mental state
  - appears ill to a healthcare professional
  - does not wake, or if roused does not stay awake
- Respiratory rate:
  - aged 5 years: 29 breaths per minute or more
  - aged 6-7 years: 27 breaths per minute or more
  - aged 8-11 years: 25 breaths per minute or more
  - oxygen saturation of less than 90% in air or increased oxygen requirement over baseline
- Heart rate:
  - aged 5 years: 130 beats per minute or more
  - aged 6-7 years: 120 beats per minute or more
  - aged 8-11 years: 115 beats per minute or more
- Mottled or ashen appearance
- Cyanosis of skin, lips or tongue
- Non-blanching rash of skin

### Moderate to high risk criteria

- Behaviour:
  - not responding normally to social cues
  - decreased activity
  - parent or carer concern that child is behaving differently from usual
- Respiratory rate:
  - aged 5 years: 24-28 breaths per minute
  - aged 6-7 years: 24-26 breaths per minute
  - aged 8-11 years: 22-24 breaths per minute
  - oxygen saturation less than 92% in air or increased oxygen requirement over baseline
- Heart rate:
  - aged 5 years: 120-129 beats per minute
  - aged 6-7 years: 110-119 beats per minute
  - aged 8-11 years: 105-114 beats per minute
- Capillary refill time of 3 seconds or more
- Reduced urine output, or for catheterised patients passed less than 1 ml/kg of urine per hour
- Tympanic temperature less than 36°C
- Leg pain
- Cold hands or feet

### Low risk criteria

- Normal behaviour
- No high risk or moderate to high risk criteria met

## Appendix 4

### Differential diagnoses to consider in children presenting with viral induced wheeze:

***Pneumonia & other pulmonary infections***, including mycoplasma & pertussis – listen for focal crackles, a productive cough, and these patients will usually have a fever, in addition to cough & tachypnoea. Consider viral, bacterial, chlamydial or mycoplasma pneumonia. This is a common alternative diagnosis for bronchiolitis.

***Bronchiolitis*** presents with several days of upper respiratory tract symptoms, including fever, rhinorrhoea and coryza. These develop into wheeze, tachypnea, increased work of breathing, a moist cough and fevers. The increased work of breathing often leads to decreased oral intake, with or without dehydration.

Auscultation of the lungs may reveal a wheeze and transmitted upper airway sounds. A focal zone with decreased air entry or coarse crackles are more consistent with pneumonia. It is well described that a typical course of bronchiolitis lasts 7-10 days, with night 2-3 being the most severe. A cough may last for up to four weeks.

***Meningitis*** should always be considered. Although it's hard to find case reports in the medical literature, unfortunately the lay press has many examples of this being mis-diagnosed.

***Foreign body aspiration*** is characterised by rapid onset and failure of initial management. May have a low-grade fever. Have a high index of suspicion in young children. Aspiration pneumonia occurs if there is poor airway protection, including spastic cerebral palsy, or in any child having seizures or convulsions.

***Croup*** usually has stridor rather than a wheeze, and with a similar gamut of causative organisms. Croup can present with a wheeze in a child with a history of bronchospasm.

***Gastro-oesophageal reflux***. 40-50% of infants with GORD present with wheeze or respiratory symptoms. There is also an association with chronic cough.

***Asthma*** an acute exacerbation is less likely to have fevers, and will often have a personal history of atopy or allergy, or a family history of asthma. It would be rare to diagnose a child under two with asthma at a first presentation to hospital with a wheeze.

***Chronic pulmonary disease***. Chronic neonatal lung disease or prematurity predisposes the child to respiratory infections.

***Mediastinal masses, tracheoesophageal fistula, and vascular rings*** are rarities but all primary care teams will have seen rarities like this – consider if recovery does not seem to occur, as expected.

***Congenital heart disease & heart failure*** should be considered in any neonate presenting with increased work of breathing, with or without apnoeas. These patients will look unwell, with a constellation of symptoms including disproportionate tachycardia, poor perfusion with or without cyanosis, weak femoral pulses & murmurs.
